

Prerequisites

1. **Azure DevOps Account:** Set up a project in Azure DevOps.
2. **Azure Databricks Workspace:** Access to an Azure Databricks workspace.
3. **Service Principal or Personal Access Token (PAT)** for Azure Databricks.
4. **Databricks CLI Installed and Configured:** The Databricks CLI will be used to interact with the Databricks workspace.

Step 1: Set Up the Databricks CLI

1. Install the Databricks CLI locally or in the agent you are using.

```
pip install databricks-cli
```

2. Configure the Databricks CLI with your workspace information and token:

```
databricks configure --token
```

You will be prompted to provide:

- Databricks Host URL
- Token (You can generate a PAT in Databricks)

Step 2: Create an Azure DevOps Pipeline

1. **Create a YAML Pipeline** in Azure DevOps.
2. **Add Variables:**
 - Add the following variables to the Azure DevOps pipeline for the Databricks configuration:
 - `DATABRICKS_HOST` : The URL of your Azure Databricks workspace.
 - `DATABRICKS_TOKEN` : The Personal Access Token.

Step 3: Azure DevOps YAML Pipeline Example

Here is a sample `azure-pipelines.yml` file to execute a Databricks notebook.

```
# social media sentiment Analysis
trigger:
- main

pool:
  vmImage: 'ubuntu-latest'

variables:
  DATABRICKS_HOST: 'https://<databricks-instance>.azuredatabricks.net'
  DATABRICKS_TOKEN: $(databricksToken)

steps:
- task: UsePythonVersion@0
  inputs:
    versionSpec: '3.x'
    addToPath: true

- script: |
  pip install -r requirements.txt
  pip install databricks-cli
```

```

  displayName: 'Install Dependencies Databricks CLI'

- script: |
  databricks configure --host $(DATABRICKS_HOST) --token $(DATABRICKS_TOKEN)
  displayName: 'Configure Databricks CLI'
  env:
    DATABRICKS_HOST: $(DATABRICKS_HOST)
    DATABRICKS_TOKEN: $(DATABRICKS_TOKEN)

- script: |
  databricks workspace import ./notebooks/SocialMedia.py /Shared/SocialMedia-1 PYTHON
  displayName: 'Upload SocialMedia Notebook '

# Step 4: Run
- script: |
  JOB_ID=$(databricks runs submit --json-file run_config.json | jq -r '.run_id')echo
  "Job ID: $JOB_ID"
  databricks runs wait --run-id $JOB_ID
  displayName:
  'Run SocialMedia Notebook'

- script: |
  python SocialMedia.py
  displayName: 'SocialMedia sentiment analysis'

```

Explanation

1. **Trigger:** The pipeline triggers when changes are pushed to the `main` branch.
2. **Pool:** It uses the latest Ubuntu image.
3. **Install Python and Databricks CLI:** The pipeline installs Python and the Databricks CLI.
4. **Configure Databricks CLI:** It configures the CLI using the environment variables (`DATABRICKS_HOST` and `DATABRICKS_TOKEN`).
5. **Upload Notebook:** The notebook (`SocialMedia.py`) is uploaded to the Databricks workspace in the `/Shared/` directory.
6. **Run Notebook:**
 - A JSON file (`run_config.json`) is used to specify the job configuration for the notebook run.
 - The `run_id` is fetched, and the pipeline waits for the job to complete.

Sample JSON Config File (`run_config.json`)

This file defines the notebook parameters and cluster settings:

```
{
  "run_name": "SocialMedia Run",
  "new_cluster": {
    "spark_version": "10.4.x-scala2.12",
    "node_type_id": "Standard_DS3_v2",
    "num_workers": 2
  },
  "notebook_task": {
    "notebook_path": "/Shared/ SOcialMedia",
    "base_parameters": {
      "param1": "value1",
```

```
      "param2": "value2"
    }
  }
}
```

Summary

- **Step 1:** The pipeline installs Python and Databricks CLI.
- **Step 2:** Configures the Databricks CLI using the host and token.
- **Step 3:** Uploads the notebook to the Databricks workspace.
- **Step 4:** Runs the notebook in Azure Databricks using the configuration from `run_config.json`.

Key Points

- **Databricks CLI:** This is used to interact with Databricks for uploading notebooks and running jobs.
- **Azure DevOps Variables:** Keep sensitive information like tokens in the Azure DevOps variable groups or secrets.
- **Run Configuration:** The JSON file (`run_config.json`) contains the configuration details for running the notebook, including cluster details.
