Prerequisites

- 1. Azure DevOps Account: Set up a project in Azure DevOps.
- 2. Azure Databricks Workspace: Access to an Azure Databricks workspace.
- 3. Service Principal or Personal Access Token (PAT) for Azure Databricks.
- 4. Databricks CLI Installed and Configured: The Databricks CLI will be used to interact with the Databricks workspace.

Step 1: Set Up the Databricks CLI

1. Install the Databricks CLI locally or in the agent you are using.

```
pip install databricks-cli
```

2. Configure the Databricks CLI with your workspace information and token:

```
databricks configure --token
```

You will be prompted to provide:

- Databricks Host URL
- Token (You can generate a PAT in Databricks)

Step 2: Create an Azure DevOps Pipeline

- 1. Create a YAML Pipeline in Azure DevOps.
- 2. Add Variables:
 - Add the following variables to the Azure DevOps pipeline for the Databricks configuration:
 - DATABRICKS_HOST: The URL of your Azure Databricks workspace.
 - DATABRICKS TOKEN: The Personal Access Token.

Step 3: Azure DevOps YAML Pipeline Example

Here is a sample azure-pipelines.yml file to execute a Databricks notebook.

```
trigger:
    main

pool:
    vmImage: 'ubuntu-latest'

variables:
    DATABRICKS_HOST: 'https://<databricks-instance>.azuredatabricks.net'
    DATABRICKS_TOKEN: $ (databricksToken)

steps:
    task: UsePythonVersion@0
    inputs:
        versionSpec: '3.x'
        addToPath: true

- script: |
        pip install -r requirements.txt
        pip install databricks-cli
```

```
displayName: 'Install Dependencies Databricks CLI'
- script: |
    databricks configure --host $(DATABRICKS HOST) --token $(DATABRICKS TOKEN)
  displayName: 'Configure Databricks CLI'
    DATABRICKS HOST: $ (DATABRICKS HOST)
    DATABRICKS TOKEN: $ (DATABRICKS TOKEN)
- script: |
    databricks workspace import ./notebooks/stocks project week2.py
    /Shared/stocks_project_week2-l PYTHON
  displayName: 'Upload Stock Analysis Notebook '
 # Step 4: Run
- script: |
    JOB_ID=$(databricks runs submit --json-file run_config.json | jq -r '.run_id')echo
    "Job ID: $JOB ID"
    databricks runs wait --run-id $JOB IDdisplayName:
  'Run stock Analysis Notebook'
 - script: |
  python deploy stock market monitoring.py
displayName: 'Deploy Stock Market Monitoring'
# Step 5: Set up Azure Monitor Metrics for stock market anomaly detection
     - task: AzureMonitorMetrics@0
      inputs:
        monitorName: 'StockMarketAnomalies'
        alertCriteria: 'Price Drop or Volume Spike Detected'
      displayName: 'Monitor Stock Market Anomalies'
```

Explanation

- 1. Trigger: The pipeline triggers when changes are pushed to the main branch.
- 2. Pool: It uses the latest Ubuntu image.
- 3. **Install Python and Databricks CLI:** The pipeline installs Python and the Databricks CLI.
- 4. Configure Databricks CLI: It configures the CLI using the environment variables (DATABRICKS HOST and DATABRICKS TOKEN).
- 5. **Upload Notebook:** The notebook (stocks_project_week2.py) is uploaded to the Databricks workspace in the /Shared/ directory.
- 6. Run Notebook:
 - A JSON file (run_config.json) is used to specify the job configuration for the notebook run.
 - The run id is fetched, and the pipeline waits for the job to complete.

Sample JSON Config File (run config.json)

This file defines the notebook parameters and cluster settings:

```
"run_name": "stockMarket Run",
"new_cluster": {
    "spark_version": "10.4.x-scala2.12",
    "node_type_id": "Standard_DS3_v2",
    "num_workers": 2
},
"notebook_task": {
    "notebook_path": "/Shared/
    stocks_project_week2",
    "base_parameters": {
        "param1": "value1",
        "param2": "value2"
      }
}
```

Summary

- Step 1: The pipeline installs Python and Databricks CLI.
- Step 2: Configures the Databricks CLI using the host and token.
- Step 3: Uploads the notebook to the Databricks workspace.
- **Step 4:** Runs the notebook in Azure Databricks using the configuration from run_config.json .

Key Points

- Databricks CLI: This is used to interact with Databricks for uploading notebooks and running jobs.
- Azure DevOps Variables: Keep sensitive information like tokens in the Azure DevOps variable groups or secrets.
- Run Configuration: The JSON file (run_config.json) contains the configuration details for running the notebook, including cluster details.
